Pro 2: Order total amount calculation

```
class Order:
    def __init__(self):
        self.total = 0

    def add_items(self):
        n = int(input("Enter number of items: "))
        for i in range(n):
            price = float(input("Enter price of item: "))
            quantity = int(input("Enter quantity: "))
            self.total += price * quantity

    def show_total(self):
        if self.total > 1000:
            self.total *= 0.9   # 10% discount
        print("Final Order Amount:", self.total)

obj = Order()
obj.add_items()
obj.show_total()
```
