Pro 4: order amount calculation

```
# Order total calculation with discount, distance, payment mode,
customer type

amount = float(input("Enter order amount: "))
distance = float(input("Enter delivery distance (km): "))
payment_mode = input("Enter payment mode (online/offline): ")
customer_type = input("Enter customer type (regular/premium): ")

discount = 0

# Discount for premium customer
if customer_type == "premium":
    discount += 0.10 * amount   # 10% discount

# Discount for online payment
if payment_mode == "online":
    discount += 0.05 * amount   # 5% discount

# Delivery charge
if distance <= 5:
    delivery_charge = 20
else:
    delivery_charge = 50
```
